

CONTROLLED WORK INSTRUCTIONS

Keep the current ISO 9001 work instruction at every workstation.

RevQR keeps one approved revision live at the point of use, shows approval and effective-date history, and adds named acknowledgement only where the process requires it.

NARROW SCOPE, STRONG AUDIT PROOF

RevQR is the controlled document layer for work instructions. It proves which revision was current, who approved it, when it became effective, and who owns the next review.

Current revision at point of use

Approval before publish

Scheduled release

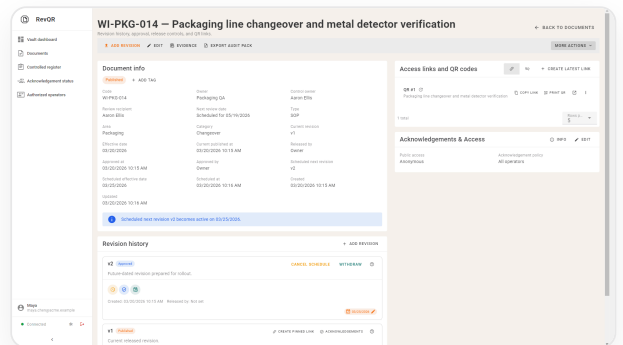

Review reminders

Audit pack export

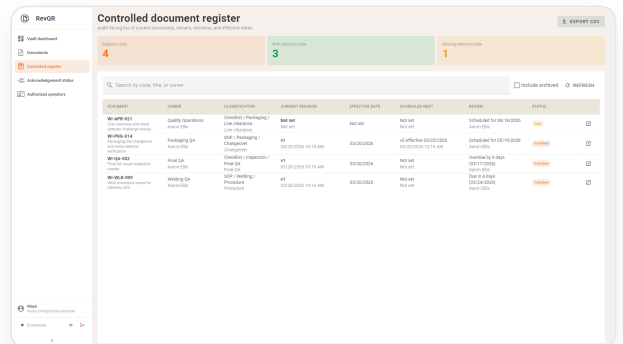

AUDIT PROOF

Show the evidence without a full QMS rollout.

- One Latest QR opens the current published revision at the station.
- Approval before publish and scheduled release keep the next revision controlled before the effective date.
- Owner, review recipient, classification, and next review date stay visible in the controlled register.
- Evidence snapshots and audit pack export preserve current-versus-scheduled context for auditors.
- Review reminders keep due-soon and overdue documents visible to the right owner.

Document detail with owner, current revision, effective date, and publication trail.

Controlled register with classification, review date, and current revision.

01

Approve before publish

Drafts move through review before they can replace the current station instruction.

02

Release by effective date

Approve now, schedule release, and keep the rollout tied to the correct date.

03

Keep reviews visible

Use reminders, audit pack export, and QR delivery without turning the rollout into a broad QMS project.

100 EUR / month

NEXT STEP

Start with one controlled-document pilot.

Pick one line, publish one released instruction, print one Latest QR poster, and prove the point-of-use flow

Unlimited users, 50 GB included, operators scan free, and a free trial is available before rollout.

before the broader rollout.
